CLUE Interface Improvements

Based on Meeting Feedback — November 2, 2026

Overview

During the November 2 meeting, Anna and Mahmood provided feedback on the CLUE interface and the upcoming user study. The following changes are intended to improve navigation, reduce participant confusion, and make the interface easier to use during the study.

1. Add Navigation Between Dashboard and CLUE

Requested change:

Add a taskbar or navigation menu that allows users to move easily between the Customer Value Dashboard and CLUE.

Implementation:

- Provide clear navigation options for the Dashboard, CLUE, and Metric Simulator.
- Make it easy to return to the previous view.
- Keep the navigation consistent across the interface.
- Review the Serendizer tool for taskbar design ideas.

2. Distinguish Best Observed From Pinned Scenarios

Requested change:

Make the Best Observed scenario visually different from pinned scenarios A, B, and C.

Implementation:

- Use a different color, such as a blue tint, for Best Observed.
- Keep pinned scenarios clearly labeled A, B, and C.
- Make it obvious which scenario is automatically identified as Best Observed and which scenarios were saved by the participant.

3. Integrate Study Tasks Into the Interface

Requested change:

Allow participants to access their study instructions without switching browser tabs.

Implementation:

- Add a task or information panel within the interface.
- Display Task 1: Metric Understanding and Task 2: Goal-Seeking instructions.
- Allow participants to reopen the instructions while completing their tasks.
- Keep the instructions visible or easily accessible without covering important interface elements.

4. Add Participant Onboarding and Tutorials

Requested change:

Create an onboarding process that introduces participants to the dataset, metrics, and study interface.

Implementation:

- Explain the e-commerce dataset and 90-Day Customer Value.
- Introduce Purchase Conversion Rate, Orders per Purchasing Customer, and Average Order Value.
- Explain how participants will navigate the interface.
- Provide a short tutorial before participants begin their study tasks.
- Ensure that participants receive the same domain introduction before using either study condition.

5. Improve CLUE's Visual Identity

Requested change:

Make CLUE visually distinct from a chatbot.

Implementation:

- Use clearer visual styling to emphasize that CLUE is an interactive metric analysis tool.
- Improve section labels and navigation so participants can easily identify the available features.
- Keep the interface consistent and easy to understand.

6. Simplify Dashboard Interactions

Requested change:

Reduce unnecessary clicks when accessing information in the Customer Value Dashboard.

Implementation:

- Review interactions that currently require multiple clicks.
- Where appropriate, make commonly used information accessible in one click.
- Keep access to the Summary and Underlying Rows views clear and intuitive.

7. Connect the Study Workflow

Requested change:

Make the Dashboard, CLUE, and study tasks feel like one connected workflow.

Implementation:

- Provide clear transitions between the Dashboard and CLUE.
- Make study instructions accessible throughout the session.
- Avoid unnecessary page switching.
- Ensure participants can easily identify which tool or task they are currently using.

Coordination and Next Steps

Whanhee

- Review the proposed interface changes.
- Use Claude to help implement the agreed updates.
- Coordinate with Simone on design decisions that need clarification.

Simone

- Review the Serendizer tool for navigation ideas.
- Prepare the 3–4 minute onboarding walkthrough video.
- Update the user study playbook based on the agreed study flow.
- Share the onboarding video and playbook with Mahmood for feedback.

Together

- Review the updated interface.
- Test navigation, task instructions, and scenario comparisons.
- Conduct pilot user studies after the interface and study materials are ready.

Items to Confirm

- Final taskbar design and placement.
- Final color and labeling for Best Observed.
- Whether task instructions should appear in an information tab or a persistent panel.
- How the common onboarding will be presented before participants enter either study condition.
- How the baseline workflow using ChatGPT and a spreadsheet will fit into the study interface.
